

Ky-31

Tall Fescue

- Attractive green color
- Considered drought resistant
- Handles traffic well
- More heat tolerant to high temperatures
- Low Maintenance
- Wide area of adaptation

Ky-31 is one of the older “proven” varieties with a light green, coarse texture. Ky-31 remains popular still because of its lower price and good overall usage qualities (drought/wear/easy establishment).

Ky-31 was originally released for planting in pastures, it still is used extensively for pasture and seed production.

Ky-31’s deep root system allows it to take a beating and spring right back up for more, making it ideal for heavy traffic or recreation areas.

Hot summers and cold winters aren’t a threat to Ky-31 as its deep root system helps it resist the drought better than typical lawn grasses.

During the fall your Ky-31 will remain greener longer.

Forage Seeding Rate:

15-20 lbs. per acre/alone

6-8 lbs per acre/mixture
