

Bulls-Eye Deer Turnips

QUICK FACTS

BULLS-EYE was originally used for food for livestock. Large numbers of deer were consistently reported grazing the lush forage and studies by wildlife biologists confirmed that deer were more attracted to **BULLS-EYE** than many of their natural occurring food sources, especially in the fall when most native species are dormant and course. Another benefit to **BULLS-EYE** is that the high nutritive value is retained well after the first frost and in fact, palatability for deer increases after a frost. **BULLS-EYE** performs best when the soil pH is between 6.5 and 7.5 and soil fertility is high. Sprouting usually occurs after 5 to 10 days depending on soil temperature.

USE

BULLS-EYE is intended for use as an attractant for deer and other wildlife. Plant **BULLS-EYE** at least 60 days before deer season if possible to allow adequate growth. This ensures that there will be enough forage to keep the deer coming back to your location for several weeks or even months. The best planting times are either Spring or Early Fall. In some cases hunters have planted plots in the spring and then replanted in the fall to keep a constant supply of lush nutritious forage for deer all through the growing season.

SELLING POINTS

- Deer Can't Resist it
- Protein Rich Food
- High Palatability
- Grows Quickly

SEEDING RATE

1-2# package covers ¼ acre

WHEN TO PLANT

Early Spring to Late Fall
